

Financial and Project Control

John Safin

John Safin,
Marketing Director

Construction Management System contains thirty applications that take raw data and create an output of daily reports, billing invoices, payroll checks, and all other operational tasks in an easy to understand format. Accounting, Payroll

and Personnel, Equipment Management, Project Controls, Operations, Service Management and other functions will make your construction company run smoother with greater coordination between your Financial and Project Management departments.

Several productivity tools compliment the financial and project management applications in Construction Management System's base product. Document Imaging/Workflow, a browser-based document image management solution, is integrated into Construction Management System to easily scan documents and associate them to an accounting/project record. The digital files are stored in association with Construction Management System functions, such as Accounts Payable, giving you both the detailed information stored within our leading financial control system and the actual invoice. Letters, print-outs, photographs, and a variety of file formats can be stored in the system. Authorized users can add comments and log entries for each document as a future reference.

Along with Computer Guidance Document Imaging, the Workflow application is the time-saving, streamlining solution for your entire company. The paper trail that currently streams through most companies represents a manual workflow process. With Computer Guidance Workflow application, an electronic (imaged) document travels via your company's computer network to any one person, group of people or departments as determined by your organization's policies.

Business Intelligence, our enhanced data-mining solution, enables you to access the data from our financial/project management system in a very powerful way. This is more than a report-writing tool. It is a comprehensive "decision support" tool that allows you to "query" your data, "report" your data and "analyze" your data.

Using our Business Intelligence functions, Construction Management System data can be formulated for easy-to-understand output for a true analysis of your financial operations. Create custom queries or reports with graphics. Automatically drill down or across a multidimensional database from within a report to receive summary information or exploded views of all the supportive details that pertain to a specific piece of information.

Document Imaging, Workflow, Business Intelligence, and the entire suite of 30 integrated applications in Construction Management System offer enterprise-wide construction software that synchronizes information and manages each aspect of every project at any time, from anywhere.

- Real-time technology for the construction industry
- A browser user interface
- Network centric data storage
- Multiple discipline financial and project management functions
- Document Imaging management and storage
- Electronic forms
- Business Intelligence data-mining functions
- Distribution controls manager allowing communication by fax, email or print on-demand
- Integrated information for your entire construction company

Integration is the key to a streamlined construction operation. Enter the data once into eCMS and it's shared with Project Administrator, our leading project manage-

ment application. Project Managers can coordinate hundreds of projects with Project Administrator, entering the data once, and the data synchronizes with Construction Management System. No double data entry, resulting in fewer data entry errors and each piece of data is instantly shared with Accounting, Payroll, Operations and all departments with permitted access to the information throughout your construction operations.

Anyone who can run a Windows application or a web browser has the skills necessary to navigate through Construction Management System. Computer Guidance Professional Services has created a hands-on curriculum to maximize learning potential and get your people working quickly. Additionally, once your staff has some experience with the software, advanced training will turn your staff into "black belts" with our Construction Management System software.

Computer Guidance offers telephone and Internet-based customer support for software and hardware products. Custom enhancements, disaster recovery and other services to keep your operations at peak performance are also offered.
